**HEALTHY AND SUSTAINABLE
DRINKING WATER
FOR EVERYONE ON SABA**

THE PRODUCTION PROCESS

At the Saba Splash water bottling plant, 160 5-gallon bottles can be filled per hour, and 180 3-gallon bottles per hour. But before the actual bottling takes place in a fully-automated, completely hygienic machine, the drinking water goes through an extensive process to make sure that it is safe, healthy, and tasteful.

The water comes up from the reverse osmosis (RO) water plant in Fort Bay and goes into a large cistern. From there, the water comes into the building where it first goes through an eco-friendly active carbon filter, then through RO filters, an ultra-violet (UV) light to kill all possible bacteria.

At that stage, magnesium and calcium are added, which are beneficial to people's health and generally don't exist in other bottled water brands.

The water then goes through an ozonating machine for disinfection without chlorine before it is stored in a large tank. The water batch goes to the machine where the water is put into the bottles. Every but reusable bottle is thoroughly cleaned before every fill.

TESTING THE QUALITY OF SABA SPLASH WATER

Samples of each batch are sent to a laboratory in St. Maarten. The bottles are distributed to the community, once the lab has confirmed that water meets all legal standards.
